SLRs, like the camera they are based on, use the same lenses but have a movable mirror and a reflex mirror on top of the lens, which enables the user to view the image on a ground-glass display inside the camera. An SLR camera is more than just a camera, it is an electronic black box that produces a precise image on a piece of photographic film. The film is loaded into the camera and the shutter of the camera is closed, which stops the exposure. The photographer then opens the shutter and the film is moved through and developed. The development process is intricate and involves chemically treating the film, exposing it to a developer, and then chemically treating it again. Today, to make sure that each exposure is developed, the film is placed in a dark environment with a lightproof box, a chemical meter checks how many exposures are left in the film, and a computer tells the camera when to take a picture and when to open and close the shutter. # What Is a Mirror Image? Mirrors and cameras are related to one another, but they are also opposites. Mirrors produce

Create a new document To create a new Photoshop Elements document, choose File > New from the main menu bar. If you need to save your project to another location, it is usually recommended to do this before opening the document, so that you can continue working from the new location. When the New Document dialog box appears, select Photoshop Elements as the file type from the File Type pop-up menu. Enter your preferred file name for the document in the Title text box. Click Next to continue. Select the correct size for the new document (e.g., 300 dpi and 300 pixels wide) in the Size text box. Click Next. In the File Location text box, enter a location to save the new document. This is where the document will be saved. Click Browse to navigate to the folder. If you don't have a folder with the same name already saved to it, it will ask you to select a folder to create one. Click Choose. If you don't have a folder with the same name already saved to it, it will ask you to select a folder to create one. Click to choose. Type a name for the folder to save the project in the New Folder text box. Click Save. Step 2. Open an existing file To open an existing file, choose File > Open, navigate to the location where you want to save the file and select the file. You can also drag and drop the file on the Photoshop Elements icon on the work space to open it. Once the file is open, just close the dialog box by clicking the X in the upper-right corner. Step 3. Crop the image This is an opportunity to crop the image. Select the Crop Tool (F7) to open the crop window. By default, it is set to 388ed7b0c7

List of drone strikes conducted by the CIA The United States Central Intelligence Agency (CIA) conducts drone strikes in specific countries against alleged terrorists, militant extremists or foreign forces considered to have a high threat of engaging in acts of terrorism. The term "targeted killing" is often used by the U.S. government to refer to drone strike operations; all but one of the U.S. drone strikes were conducted by the CIA. History The CIA has operated armed drones since the mid-1960s, long before the current drone policy and before the program became publicly known. In 2010, the CIA began reworking its drone campaign to involve electronic surveillance. By 2012, the CIA was conducting aerial drone strikes in Pakistan, using Predator drones. A total of 157 strikes took place between 2004 and 2013 in Pakistan, Afghanistan, Yemen and Somalia. The estimated total number of non-combatant deaths is unclear. The total number of civilian and militant deaths is approximately 400 and is estimated by the Bureau of Investigative Journalism. As of early 2014, the United States does not publicly acknowledge conducting drone strikes in any country. A U.S. government spokesperson has explained the rationale behind this stance as: There was a wave of drone strikes in Pakistan during 2011 and 2012. U.S. officials cited the Al-Qaeda prison camps in eastern Libya, sometimes called "the Benghazi ready-made prison", as justification for the strikes, in particular a CIA drone strike on a house in December 2011, which killed Anas al-Liby, a Libyan al-Qaeda leader. In 2012, President Barack Obama said the U.S. would probably not publicly discuss drone strikes: A new policy was announced in 2013, saying the CIA would not conduct drone strikes outside of the U.S. and those that are conducted would be authorized by the president. Activities In 2016, a former drone pilot said that the CIA operated two drone fleets, one in the eastern U.S. that targets terrorists in Afghanistan and Pakistan. Another, carrying out strikes in Yemen, was based at a base in Saudi Arabia. In 2007, the US president declared a "Global War on Terror" and the total number of US citizens targeted by drone strikes increased. Among those targeted were Nazih Abdul-Hamed al-Ruqai, a Palestinian militant who was accused of directing suicide bombings in Israel and multiple US citizens. In 2015, a former CIA drone pilot said that drones were used

Field of the Invention The present invention relates to an apparatus for suppressing a double image produced due to a double exposure in a case where a film is developed through two or more different processing solutions to form a negative image and a positive image. 2. Description of the Prior Art In a case where a film which is developed through two or more different processing solutions to form a negative image and a positive image is printed out by a printing method such as a letter press, plate making or the like, a double image may be produced due to the double exposure, that is, the negative image and the positive image may be mixed up in the printing process. In order to solve this problem, the prior art disclosed in U.S. Pat. No. 4,606,482 (Re.33,786) comprises an image processing unit which stores an image signal input through an image pickup section and which outputs an image control signal on the basis of the image signal. The image control signal is used to control the quantity of the printing ink to be supplied to a printing device and the density of the image to be formed in the printing process. The image signal to be processed by the image processing unit is produced by scanning the negative and the positive films which are attached on a plate or the like through a flat-bed scanner. Then, the image control signal is set in accordance with the image signal, and thereby the double image is suppressed to a desired level. However, in the prior art, when the negative and positive films which have the same size as the scanning area of the image pickup section are attached on the same plate, the same image is stored in the image processing unit, and thus, the image control signal is determined on the basis of the double image produced in the scanning process. In this case, the degree of suppression of the double image can only be set in accordance with the ratio of the
